Grafting 15-Page Guide

Introduction to Grafting.

What is grafting? Grafting is a horticultural technique whereby tissues of plants are joined so as to continue their growth together. The upper part of the combined plant is called the scion while the lower part is called the rootstock.

Page 2: Benefits

Grafting can accelerate maturity and improve resistance to soil-borne diseases.

Page 3: Healing Conditions

For the graft union to heal properly, certain conditions must be met.

What temperature is recommended for healing? A temperature of 75-80 degrees Fahrenheit (24-27 Celsius) is recommended for optimal healing.
